

Improve Your Cubicles

In the past 20 years advances in dairy housing technology has lead to doubling the hours cows spend resting in their stalls. This has delivered higher milk yields & lower lameness.

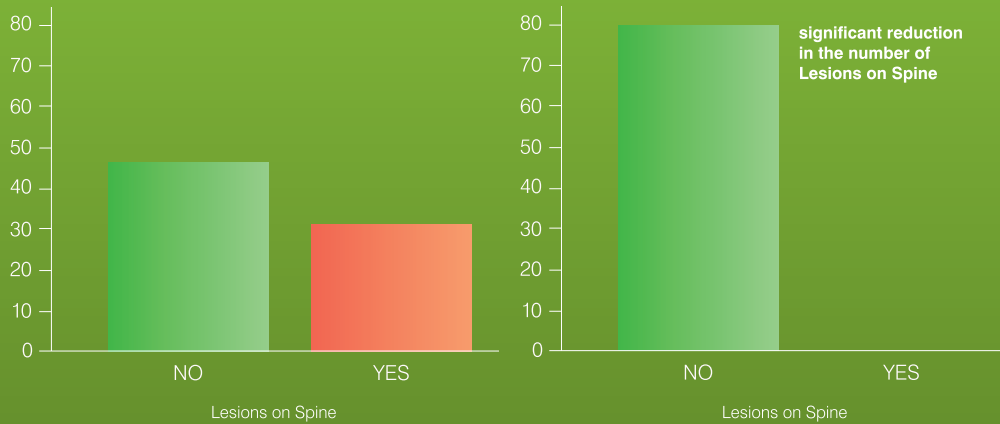

Reduced Lesions on the Spine

Increasing the time cows spend in contact with the stall division often results in spinal lesions, affecting the locomotion of the cow and eventually impacting upon lameness.

Improved Cleanliness

The unique open fronted Cowcoon design with its flexible lower tube ensures that cows rest straighter and not under the stall divisions, ensuring an injury free rest period, with cows unable to defecate or urinate on the beds, resulting in clean cows.

Before cowcoon

After cowcoon

Before: Increasing lying times often results in spinal lesions

After: Healthy cows with no spinal lesions

Before: Dirty beds result of poor positioning

After: Increased resting periods and cleaner cows
